

System Management Recabling Plan

Overview

System Management will update racks x3701 and x3507. Only management and primary ethernet networks will be updated. No high speed updates are required.

Rack x3701 Switch Updates

Add the Aruba 6300 and two 8325's to u47, u46, and u45. The XD670 ILO ports on the existing management switch (MAN-3701U48) will be removed. Everything else on that switch will remain connected. No changes to the high speed sitches (HSNL-3701U42 and HSNL-3701U43) are required. An existing Aruba 8325 is currently in the rack and can be repurposed for this work.

A	manage man-3701u48	B	48
	Aruba 6300M 48G		47
	Aruba 8325 32P 100G		46
	Aruba 8325 32P 100G		45

B	NDR hsnl-3701u42	A	42
			41

Note: New (and repurposed) switches shown with a green background.

Rack x3507 Switch Updates

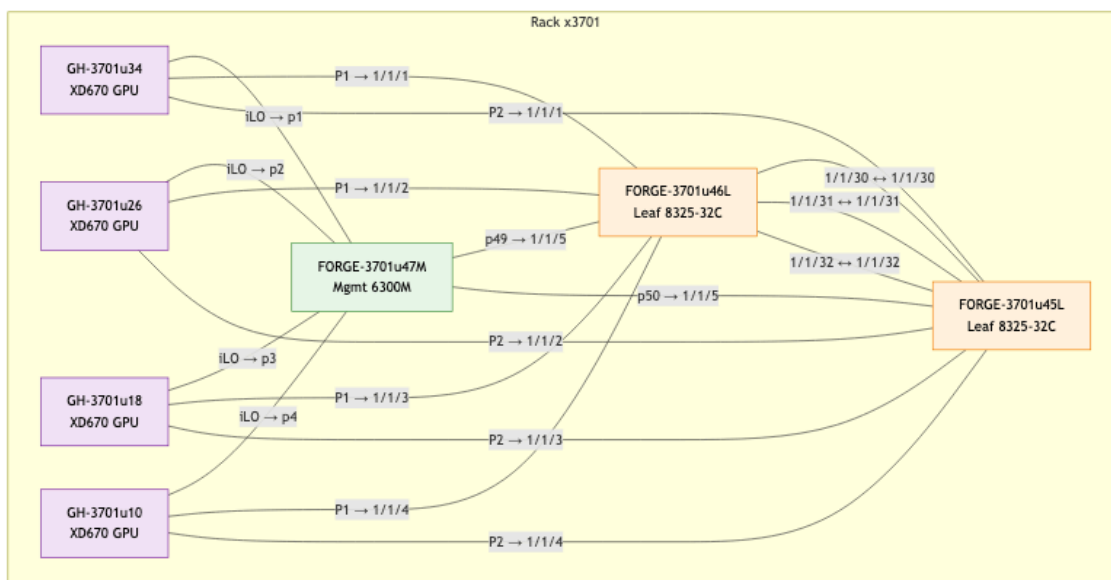

Add the Aruba 6300, two 9300's, and two 8325's to u43 through u47. No changes to the high speed sitches (HSNL-3507U42 and HSNL-3507U43) are required. The bottom DL380 (SERV-3507U05) should not have it's ILO port recabled; it should remain attached to the management switch in rack x3508. Add an additional cable to the onboard NIC of SERV-3507U05 and connect it to another port on the same management switch in rack x3508. Update the ZenDesk ticket with the ILO port number and the onboard NIC port number for SERV-3507U05.

Two DL380's (DL-3507U23 and DL-3507U25) are NOT included in this recabling effort. No cables should be removed. Anything that that these nodes are cabled to should be left in place.
